Assignment 6

- My installation is an animated visual display meant to accompany the band RVZXR's performance of the song "Bitter" at a medium-sized concert venue on their next tour.
- The base input for my display is the mixed audio from the performers. This is split into two registers, separating the highs from the lows.
 - The lower register's gain transitions through color shifts from a pale purple to red as it increases.
 - The uniform scale of the razors increases with the gain of the lower register.
 - The lower register also controls the density and range of the particles.
 - The higher register's gain determines the amplitude of the noise in the particle movement.
 - The higher register also controls the rotation of the razor objects.
